This well and one other drilled two years ago are the only two producing from the Big Injun. This well was drilled originally to the Gordon ~~zone~~ but was plugged back to the Injun about 7 years ago. It produced about 80 bbls. initial. The Injun well above this (B. A. Swiger No. 6) produced 14 bbls. initial and is producing 7 bbls. per week and 15 bbls. salt water per day at present. Both wells are pumped constantly or should be. Some Maxton production is claimed for spotty localities. Some red rock present. Average for this run is 2 to 4 bbls. per week in Gordon Sand.
